As long as $V_m < V_{\text{th}}$:

$$\frac{dG_E}{dt} = -\frac{1}{\tau_E} G_E + \sum G_E^{\text{syn}}(t_i) \delta(t - t_i)$$

$$\frac{dG_I}{dt} = -\frac{1}{\tau_I} G_I + \sum G_I^{\text{syn}}(t_i) \delta(t - t_i)$$

$$\frac{dG_B}{dt} = -\frac{1}{\tau_B} G_B + \sum G_B^{\text{syn}}(t_i) \delta(t - t_i)$$

$$V_{\infty} = \frac{V_{\text{rest}} + V_E G_E + V_I G_I + V_B G_B + G_{\text{gap}}}{1 + G_E + G_I + G_B + \text{sumgap}}$$

$$\frac{dV_m}{dt} = -\frac{1}{\tau} (1 + G_E + G_I + G_B + \text{sumgap}) (V_m - V_{\infty})$$

$$\frac{dV_{\text{th}}}{dt} = -\frac{1}{\tau_{\text{th}}} (V_{\text{th}} - V_{\text{thresh}})$$

When $V_m \geq V_{\rm th}$, activity spikes and

$$V_m^+ = V_{\text{rest}}$$

$$V_{\text{th}}^+ = V_{\text{th}}^- + \Delta V_{\text{th}}$$

$$G_B^+ = G_B^- + 1$$
